LIMA®

Insight-led IT services

Put plans in place now for tomorrow's cyber challenges.

Stay one step ahead with these six important benefits.

A **cyber resilience review** from LIMA helps you plan for tomorrow's challenges, whether you're in a strictly regulated industry, a business with a low appetite for risk – or just looking to elevate your existing security footprint.

Unrivalled experience

A new cyber-threat landscape is emerging for business. LIMA's dedicated team has some of the brightest minds in cyber resilience, equipped to empower your IT leadership and the wider executive group with a detailed, effective corporate risk register, benchmarked against Cyber Essentials Plus and ISO27002.

Tried and tested approach

For 25+ years, LIMA has partnered with UK businesses as an IT provider of choice. In that time we've developed an airtight, **seven-step process for risk assessment** which delivers a proposed risk action plan for the most pressing issues, and a potential roadmap for implementation.

Equal priority to people, process and platform

Risk assessment starts with your platform and IT infrastructure; but in our reviews we always put equal focus on the education and behaviours associated with your people, and with the processes that support them.

Clear, actionable plan

A proposed risk action plan from LIMA starts with any urgent, tactical work to be carried out as a priority. We give you the information, the insights and the tooling to target the gaps in your security plan. From there you can detect threats and respond to them, from ransomware to cyber-attacks.

Resilience embedded for the long term

With our help, you can establish appropriate ongoing controls to neutralise potential threats, and adapt as threats get more sophisticated. We prioritise vulnerable areas, embedding resilience and harnessing the power of cloud-based backup so you can maintain a strong, continuous cyber posture into the future.

Vulnerabilities under the microscope

LIMA's managed vulnerability assessment service (MVAS) helps you identify vulnerabilities and risk priorities, with advice on remediation to keep you secure and compliant. Managed detection and response (MDR) gives an enterprise-grade cyber security capability at a fraction of the cost of building inhouse. Extended detection and response (EDR) and pentesting complete the package.

Immutable backup is now one of our most in-demand data security services. Get in touch with one of our experts.
